TABULATED PRESSURE COEFFICIENTS AND
AERODYNAMIC CHARACTERISTICS MEASURED ON THE WING OF THE
BELL X-1 AIRPLANE IN LEVEL FLIGHT AT MACH NUMBERS FROM
0.79 TO 1.00 AND IN A PULL-UP AT A
MACH NUMBER OF 0.96

By H. Arthur Carner and Mary M. Payne

SUMMARY

Tabulated pressure coefficients and aerodynamic characteristics are presented for six spanwise stations on the left wing of the Bell X-1 research airplane. The data were obtained in level flight at Mach numbers from 0.79 to 1.00 and in a pull-up to an airplane normal-force coefficient of 0.91 at a Mach number of approximately 0.96.

INTRODUCTION

Flight tests are being conducted to determine the spanwise and chordwise loading on the wing of the Bell X-1 research airplane throughout the transonic and low supersonic range. The purpose of the present paper is to present the data obtained in a level run through a Mach number range from 0.79 to 1.00 and for an airplane normal-force-coefficient range from 0.27 to 0.91 at a Mach number of approximately 0.96. Analyzed data for station D (64.4 percent semispan) are presented in reference 1.

SYMBOLS

M	free-stream Mach number
n	normal load factor
W	airplane weight, pounds

S	wing area, including area projected through fuselage (130 sq ft)
S'	area of wing panels outboard of station A (99.4 sq ft)
C _{NA}	airplane normal-force coefficient (nW/qS)
δ_{aL}	left aileron angle, deg
b/2	wing semispan (14 ft)
b'/2	spanwise distance from station A to wing tip (11.42 ft)
c	local wing chord parallel to plane of symmetry, feet
\bar{c}	average chord of wing panel, feet (S'/b')
c'	mean aerodynamic chord of wing panel (M.A.C.), feet $\left(\frac{2}{S} \int_0^{b'/2} c^2 dy' \right)$
x	chordwise distance from leading edge of local chord, feet
y	spanwise distance outboard of airplane center line, feet
y'	spanwise distance outboard of station A, feet
q	free-stream dynamic pressure, pounds per square foot
p _o	free-stream static pressure, pounds per square foot
p	local static pressure, pounds per square foot
p _u	local static pressure on upper surface, pounds per square foot
p _l	local static pressure on lower surface, pounds per square foot
P	pressure coefficient $\left(\frac{p - p_o}{q} \right)$
P _R	resultant pressure coefficient $\left(\frac{p_l - p_u}{q} \right)$
c _n	section normal-force coefficient $\left(\int_0^1 P_R d \frac{x}{c} \right)$

$c_{m_c}/4$ section pitching-moment coefficient about 0.25-local-chord point $\left(\int_0^1 -P_R \left(\frac{x}{c} - 0.25 \right) d \frac{x}{c} \right)$

c_m' section pitching-moment coefficient about a line perpendicular to longitudinal axis of airplane, passing through 0.25-chord point of mean aerodynamic chord of wing panel
 $\left(\int_0^1 -P_R \left(\frac{x}{c} - \frac{0.40c - 0.15c'}{c} \right) d \frac{x}{c} \right)$

c_N' wing-panel normal-force coefficient $\left(\int_0^1 c_n \frac{c}{c'} d \frac{2y'}{b'} \right)$

c_BM' wing-panel bending-moment coefficient about station A
 $\left(\int_0^1 c_n \frac{c}{c'} \frac{2y'}{b'} d \frac{2y'}{b'} \right)$

c_M' wing-panel pitching-moment coefficient about 0.25 mean aerodynamic chord $\left(\frac{\bar{c}}{c'} \int_0^1 c_m' \left(\frac{c}{c'} \right)^2 d \frac{2y'}{b'} \right)$

c.p. center of pressure

DESCRIPTION OF AIRPLANE AND TEST PANEL

The Bell X-1 research airplane used in these tests is shown in figure 1. A three-view drawing of the airplane showing the general overall dimensions is given as figure 2. The spanwise and chordwise locations of the pressure-measuring orifices are shown in figure 3.

The airplane has a 10-percent-thick wing and incorporates an NACA 65-110 airfoil section with slight modifications. The ordinates of the airfoil section are given in table 1. Over the landing flap, the section is modified rearward of the 0.85-chord point to give a finite trailing-edge thickness; over the ailerons, the cusp is replaced by a straight taper from 0.85 chord to the trailing edge (reference 2). A line passing through the 0.40-chord point of the local chords is perpendicular to the longitudinal axis of the airplane. The wing has an incidence angle with respect to the fuselage axis of 2.5° at the root and 1.5° at the tip, an aspect ratio of 6, and a taper ratio of 0.5. The skin thickness is approximately 0.4 inch at the root and 0.15 inch at the tip. The wing

was painted and polished during the test, but no refined filling or smoothing was attempted.

INSTRUMENTATION

Standard NACA recording instruments were used to obtain airspeed, pressure altitude, normal acceleration, and control positions. Wing-surface pressures were measured by two NACA recording multiple manometers. All records were synchronized by a common timer.

Free-stream static and dynamic pressures were recorded with an NACA high-speed pitot-static head located at the left wing tip. The static vents were located approximately 0.96 of the local chord ahead of the wing.

Wing-surface pressures were measured from flush-type orifices installed in the wing skin. The orifices were connected to the instrument compartment by $\frac{1}{8}$ -inch-inside-diameter aluminum tubing. Rubber tubing of $\frac{3}{16}$ -inch inside diameter was used between the aluminum tubing and the manometer cells. The length of the aluminum tubing varied from about 2 feet at the root station to about 14 feet at the tip station. About 3 feet of rubber tubing were used on each line.

ACCURACY

The accuracy of the test results is estimated to be within the following limits:

Mach number	±0.01
P	±0.02
c_n	±0.05
$c_m/c_{1/4}$	±0.006

TESTS

The data presented herein were obtained in level flight for a Mach number range of 0.79 to 1.00 at an airplane normal-force coefficient of approximately 0.31 and in a pull-up to an airplane normal-force coefficient of 0.91 at a Mach number of 0.96. Rolling velocities were low

despite a lateral oscillation encountered in the Mach number region of the tests. The ailerons were held close to neutral through most of the speed run and during the pull-up.

METHODS

The wing is treated herein as an isolated panel and the coefficients obtained from the pressure distributions are based on the geometric properties of the wing panel outboard of station A (fig. 3(a)). Station A is approximately 3 inches outboard of the wing-fuselage junction and 31 inches outboard of the center line of the airplane.

The pressure differential was measured at stations A, B, C, E, and F (fig. 3(a)). At station D, the individual surface pressures were measured relative to the instrument compartment pressure. Static pressure at the pitot-static head was also measured relative to compartment pressure. The measured static pressure at the boom was corrected to free-stream static pressure by use of the radar-tracking method of reference 3.

Ground tests were made to determine any effects of lag that might be present in measuring the wing-surface pressures. These tests show that the effects of lag are negligible and have been neglected in these data.

Section coefficients were obtained by mechanical integration of the chordwise pressure distributions. Panel coefficients were obtained by spanwise integration of the section coefficients.

PRESENTATION OF RESULTS

Table 2 presents the measured pressure coefficients and aerodynamic characteristics obtained in a level run from a Mach number of 0.79 to 1.00. Pressure coefficients are not presented for all the orifices as some of the orifices were inoperative during the tests. Some of the manometer cells did not have an adequate range to measure all pressures encountered; thus, pressure coefficients are not presented for the times when these cells were off scale.

Presented in table 3 are the measured pressure coefficients and aerodynamic characteristics obtained in a pull-up at a Mach number of approximately 0.96.
